Pengaruh Penerapan *Caring Leadership* terhadap Pelaksanaan Pencegahan Pasien Jatuh

xxxi + 86 halaman + 13 tabel + 5 gambar + 10 lampiran

Insiden jatuh menjadi perhatian bermakna sebagai penyebab cedera, morbiditas, dan mortalitas. Perawat berperan penting dalam keberhasilan pencegahan pasien jatuh. Pelaksanaan pencegahan pasien jatuh oleh perawat yang kurang baik dapat meningkatkan angka kejadian pasien jatuh. Upaya meningkatkan kinerja perawat dapat dilakukan dengan menerapkan gaya kepemimpinan yang efektif. *Caring leadership* sebagai gaya kepemimpinan yang dapat memfasilitasi kebutuhan perawat dan memotivasi perawat dalam capaian kinerja menjadi faktor penting dalam pencegahan pasien jatuh. Penelitian ini bertujuan untuk menganalisa pengaruh penerapan *caring leadership* terhadap pelaksanaan pencegahan pasien jatuh oleh perawat. Metode penelitian yang digunakan adalah *quasi experiment with pretest-posttest with control group design*. Total sampel berjumlah 38 perawat pelaksana yang diambil dengan teknik *purposive sampling*. Observasi dilakukan secara langsung untuk mengukur pelaksanaan *caring leadership* dan pelaksanaan pencegahan pasien jatuh. Data dianalisa menggunakan uji *statistic non parametric Wilcoxon* dan *Mann-Whitney*. Hasil penelitian menunjukkan ada perbedaan nilai rata-rata pelaksanaan pencegahan pasien jatuh sebelum dan sesudah penerapan *caring leadership* dengan nilai *p-value* 0,000, yang artinya ada pengaruh penerapan *caring leadership* dalam meningkatkan pelaksanaan pencegahan pasien jatuh. Penerapan *caring leadership* di rumah sakit sebaiknya dilakukan secara konsisten sehingga mampu meningkatkan kinerja perawat dalam pencegahan pasien jatuh.

Kata kunci: *Caring leadership*, pencegahan pasien jatuh

The Effect of Application of Caring Leadership on Fall Prevention Implementation

xxxi + 86 pages + 13 tables + 5 figures + 10 appendixes

The incidence of falls is a significant concern as a cause of injury, morbidity and mortality. Nurses have an important role in the success of prevention of falls. Poor implementation of fall prevention can increase the incidence of falls. Efforts to improve nurse performance can be done by implementing an effective leadership style. Caring leadership as a leadership style that can facilitate the needs of nurses and motivate nurses to achieve performance is an important factor in preventing falls. This study aims to analyze the effect of applying caring leadership on the implementation of fall prevention by nurses. The research method used was a quasi-experiment with pretest-posttest with control group design. The samples were 38 staff nurses taken by purposive sampling technique. Observations were carried out directly to measure the implementation of caring leadership and implementation of prevention of falls. Data were analyzed using non parametric Wilcoxon and Mann-Whitney statistical tests. The results showed that there were differences in the mean value of the prevention of falls before and after the application of caring leadership with a p-value of 0.000, which means that there was an effect of the application of caring leadership on increasing the implementation of prevention of falls. The application of caring leadership in hospitals should be carried out consistently to increase the performance of nurses in preventing falls.

Keywords: Caring leadership, prevention of falls
