

(Wasagu *et al.*, 2017) selain itu apu-apu juga mengandung tanin yang mampu menghambat penyerapan nutrien (Trivianni, 2014).

4.2. Bobot relatif dan Panjang Usus Halus (Duodenum, Jejunum dan Ileum)

Bobot relatif dan panjang usus halus (duodenum, jejunum dan ileum) itik Magelang jantan yang diberi ransum dengan penggunaan tepung apu-apu pada level yang berbeda disajikan pada Tabel 5.

Tabel 5. Bobot Relatif dan Panjang Usus Halus (Duodenum, Jejunum dan Ileum)

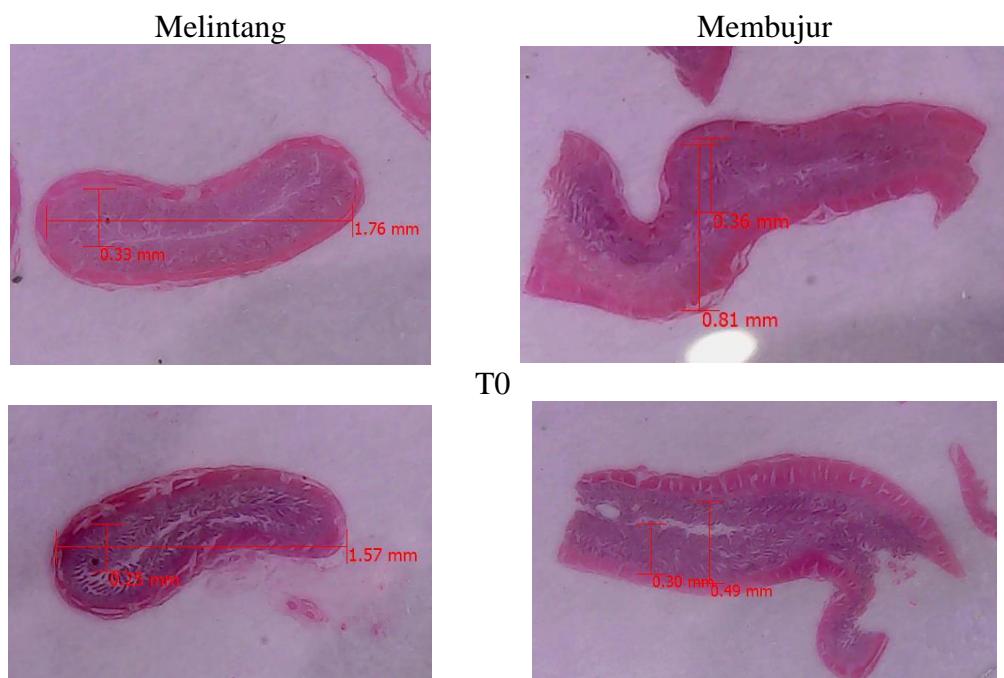

Parameter	Percentase apu-apu dalam ransum percobaan				SE
	T0 (0%)	T1 (6%)	T2 (12%)	T3 (18%)	
Bobot relatif usus halus (%)	3,68±0,32	3,35±0,31	3,73±0,44	3,23±0,23	0,15
Bobot relatif duodenum (%)	0,74±0,07 ^a	0,63±0,05 ^b	0,75±0,08 ^a	0,54±0,04 ^c	0,03
Bobot relatif jejunum (%)	1,56±0,18	1,43±0,15	1,59±0,26	1,34±0,08	0,08
Bobot relatif ileum (%)	1,39±0,17	1,29±0,15	1,37±0,18	1,35±0,14	0,07
Panjang usus halus (cm)	159,60±10,90	152,40±6,43	172,90±18,02	152,60±12,34	5,64
Panjang duodenum (cm)	28,60±1,67	28,00±2,00	31,20±2,95	26,80±2,86	1,08
Panjang jejunum (cm)	69,40±3,85	67,00±4,42	74,40±8,17	65,00±6,12	2,63
Panjang ileum (cm)	61,60±6,35	57,40±3,78	67,30±8,70	60,80±5,07	2,79

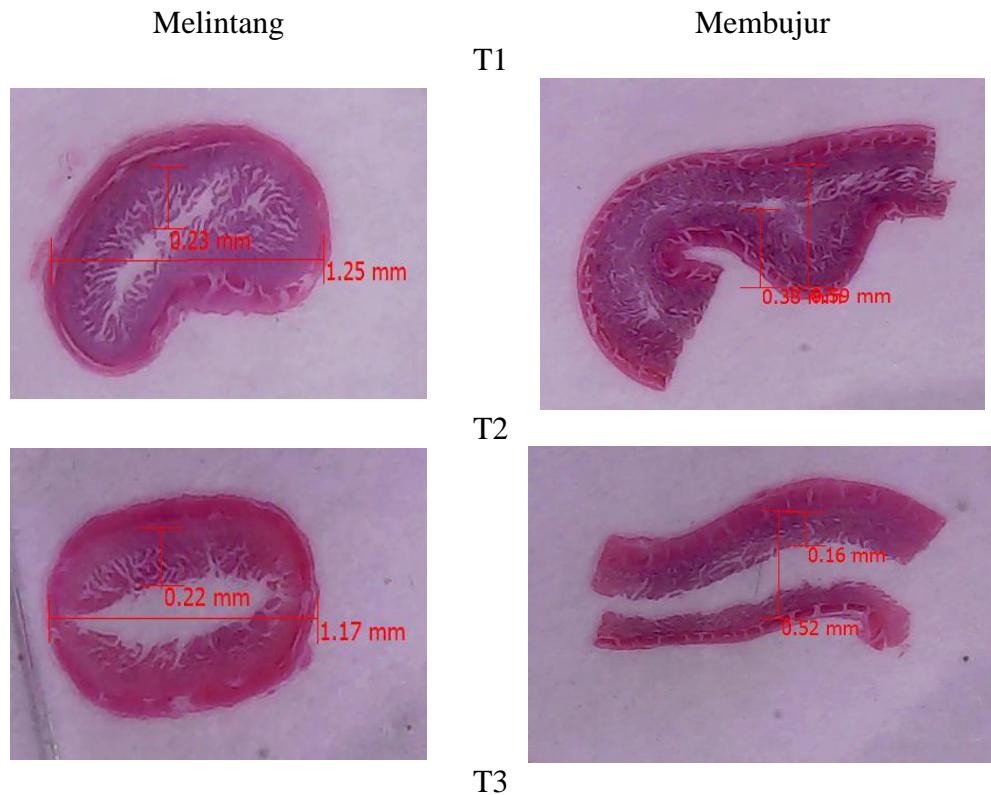

Keterangan : Superskrip berbeda pada baris yang sama menunjukkan angka yang berbeda nyata ($P<0,05$)

Hasil penelitian pada Tabel 5 menunjukkan bahwa perlakuan penggunaan tepung apu-apu tidak berpengaruh nyata ($P>0,05$) mempengaruhi bobot relatif usus halus, jejunum, ileum, panjang usus halus (duodenum, jejunum dan ileum) namun berpengaruh nyata ($P<0,05$) menurunkan bobot relatif duodenum. Harianto (2016) menyatakan bahwa pada penelitian pemberian tepung kunyit (*Curcuma longa*) dalam pakan terhadap usus menghasilkan bobot relatif usus halus antara

2,95 - 3,37% dan panjang usus halus 153,5 - 163,75cm. Menurut Sumiati dan Sumirat (2003) dalam penelitian mengenai persentase bobot saluran pencernaan itik lokal (*Anas platyrhynchos*) yang diberi kayambang (*Salvinia molesta*) dalam ransum memiliki bobot relatif duodenum (0,6 – 0,74%), jejunum (1,34 - 1,44%) dan ileum (1,2 – 1,47%). Wasilewski *et al.* (2015) menyatakan bahwa pada penelitian struktur sistem pencernaan itik menurut jenis kelamin dan genetik menghasilkan panjang duodenum (32,4 - 34cm), jejunum (92,3 – 94,8cm) dan ileum (89,9 – 91,6cm).

Penggunaan tepung apu-apu tidak berpengaruh nyata ($P>0.05$) mempengaruhi bobot relatif usus halus, jejunum, ileum, panjang usus halus (duodenum, jejunum dan ileum) namun berpengaruh nyata ($P<0,05$) menurunkan bobot relatif duodenum. Penggunaan tepung apu-apu mulai menunjukkan adanya perubahan pada morfologinya yang dapat dilihat pada preparat ileum yang disajikan pada Ilustrasi 5.

Ilustrasi 5. Preparat Histologi Melintang dan Membujur Organ Ileum dengan Perbesaran 500×

Berdasarkan Ilustrasi 5 dapat diamati bahwa organ ileum mulai mengalami penurunan kondisi fisik. Penurunan kondisi fisik organ usus halus tersebut disebabkan oleh beberapa hal yaitu adanya kandungan antinutrisi dan tingginya kandungan abu atau mineral. Antinutrisi yang ditemukan pada apu-apu berupa tanin (Trivianni, 2014). Tanin memiliki peran dapat mengikat protein sehingga dapat menghambat penyerapan nutrien sehingga organ mengalami penurunan kondisi fisik (Setyawan *et al.*, 2013). Kondisi vili pada preparat (Ilustrasi 5) menunjukkan penurunan kondisi ileum yang ditunjukkan dengan menipisnya atau teragregasinya dinding ileum. Apu-apu juga memiliki nilai positif berupa kandungan asam amino yang beragam, antara lain asam aspartat, serin, asam

glutamat, glisin dan histidin (Lampiran 1). Apu-apu mengandung pula inulin sebesar 1,83%. Inulin memiliki peran mampu meningkatkan pencernaan protein (Fanani *et al.*, 2016).

4.3. Bobot relatif dan Panjang Usus Besar dan Seka

Bobot relatif dan panjang usus besar dan seka itik Magelang jantan yang diberi ransum dengan penggunaan tepung apu-apu pada level yang berbeda disajikan pada Tabel 6.

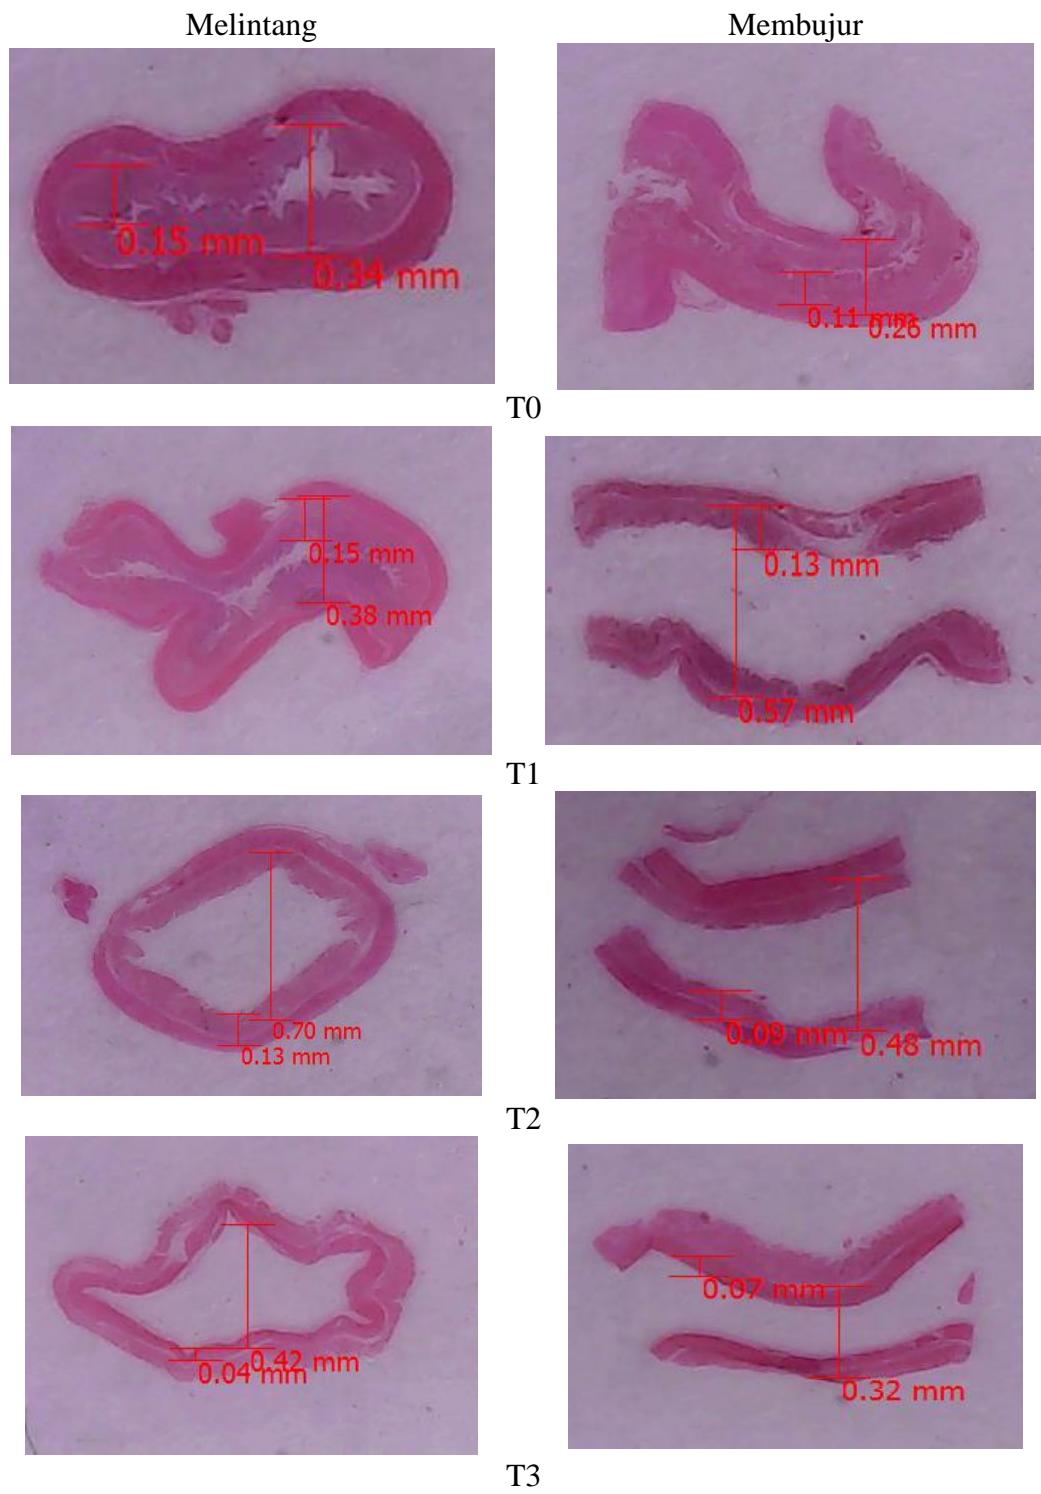

Tabel 6. Bobot Relatif dan Panjang Panjang Usus Besar dan Seka

Parameter	Percentase apu-apu dalam ransum percobaan				SE
	T0	T1 (6%)	T2 (12%)	T3 (18%)	
Bobot relatif seka (%)	0,27±0,11	0,33±0,07	0,37±0,007	0,26±0,05	0,03
Bobot relatif usus besar (%)	0,49±0,19 ^a	0,38±0,09 ^{ab}	0,35±0,10 ^{ab}	0,24±0,05 ^b	0,05
Panjang seka (cm)	24,90±2,30	26,90±1,43	28,00±2,55	25,20±3,77	0,09
Panjang usus besar (cm)	12,20±1,30	11,20±2,59	10,60±2,88	8,90±0,89	1,18

Keterangan : Superskrip berbeda pada baris yang sama menunjukkan angka yang berbeda nyata ($P<0,05$)

Hasil penelitian pada Tabel 6 menunjukkan bahwa bobot relatif seka dan panjang seka tidak berpengaruh nyata ($P>0,05$) terhadap perlakuan penggunaan tepung apu-apu. Bobot relatif seka antara 0,26 - 0,37% dan panjang seka antara 24,90 - 28cm. Sumiati dan Sumirat (2003) melaporkan bahwa dalam penelitian penggunaan kiambang dalam ransum itik menghasilkan bobot relatif seka antara 0,35 - 0,45% dimana taraf perlakuan yang diberikan lebih tinggi (40%). Sutrisna (2011) melaporkan pada penelitian mengenai tingkat serat kasar dalam ransum terhadap perkembangan organ pencernaan itik menunjukkan bahwa panjang seka antara 16,93 – 18cm.

Penggunaan tepung apu-apu terhadap bobot relatif dan panjang seka tidak berpengaruh nyata ($P>0,05$) terhadap perlakuan penggunaan tepung apu-apu dalam ransum, namun mulai memperlihatkan perubahan pada morfologi seka. Perubahan morfologi memperlihatkan perubahan ketebalan dinding seka (Ilustrasi 5.) yang mulai mengalami penipisan dari perlakuan kontrol (T0) terhadap perlakuan ransum (T1, T2, T3). Hal tersebut dikarenakan seka berfungsi sebagai tempat mencerna serat kasar. Semakin tinggi serat kasar maka semakin besar kerja seka. Apu-apu mengandung serat kasar yang tinggi dapat menjadi salah satu faktor penipisan dinding seka, selain itu juga mengandung antinutrisi serta kadar abu yang tinggi dalam ransum. Hal tersebut dapat diamati pada Tabel 6. menunjukkan hasil bobot relatif seka dan panjang seka pada perlakuan T2 (12%) memiliki hasil yang paling tinggi dibanding perlakuan yang lain. Bobot relatif dan panjang seka semakin meningkat seiring peningkatan penggunaan tepung apu-apu dalam ransum, namun pada T3 (18%) mulai mengalami penurunan, sehingga pemberian ransum hingga T3 atau hingga level 18% masih dapat diberikan namun pemberian maksimal hingga masa pemeliharaan selama 7 minggu. Frandson *et al.* (2009) menyatakan bahwa serat kasar dicerna di bagian seka. Serat kasar merupakan salah satu faktor yang mempengaruhi perkembangan usus (Iriyanti *et al.*, 2018).

Ilustrasi 6. Preparat Histologi Melintang dan Membujur Organ Seka dengan Perbesaran 500×

Hasil pada Tabel 6 menunjukkan hasil penelitian bahwa perlakuan penggunaan tepung apu-apu berpengaruh nyata ($P<0,05$) mempengaruhi bobot relatif usus besar dan tidak berpengaruh nyata ($P>0,05$) mempengaruhi panjang usus besar. Sumiati dan Sumirat (2003) pada penelitian itik yang diberi pakan kiambang 40% menghasilkan presentase bobot usus besar 0,34 - 0,43%. Sutrisna (2011) pada penelitian itik yang diberi pakan dengan serat kasar yang berbeda menghasilkan panjang usus besar antara 9,63 – 11,13cm.

4.4. pH Organ Pencernaan

pH organ pencernaan itik Magelang jantan yang diberi ransum dengan penggunaan tepung apu-apu pada level yang berbeda disajikan pada Tabel 7.

Tabel 7. Bobot Relatif dan Panjang Panjang Usus Halus (Duodenum, Jejunum dan Ileum)

Parameter	Percentase apu-apu dalam ransum percobaan				SE
	T0	T1 (6%)	T2 (12%)	T3 (18%)	
pH Proventrikulus	6,04±0,30	6,02±0,36	6,28±0,31	6,00±0,23	0,14
pH Duodenum	6,36±0,17	6,26±0,11	6,40±0,14	6,22±0,22	0,07
pH Jejunum	6,36±0,27	6,26±0,11	6,26±0,11	6,20±0,17	0,08
pH Ileum	6,46±0,19	6,36±0,21	6,40±0,16	6,28±0,13	0,08
pH Seka	6,52±0,06	6,36±0,03	6,44±0,02	6,20±0,06	0,11

Keterangan : Superskrip berbeda pada baris yang sama menunjukkan angka yang berbeda nyata ($P<0,05$)

Hasil penelitian pada Tabel 7 menunjukkan bahwa perlakuan penggunaan tepung apu-apu berpengaruh tidak nyata ($P>0,05$) mempengaruhi pH proventrikulus, duodenum, jejunum, ileum dan seka. Proventrikulus memiliki pH antara 6-6,28; pH duodenum antara 6,22 - 6,40; pH jejunum antara 6,2 - 6,6,36;

pH ileum antara 6,28 - 6,46 dan pH seka antara 6,2 – 6,52. Amrullah (2004) menyatakan pada ayam proventrikulus memiliki pH yang lebih rendah. Menurut Gauthier (2002) pH proventrikulus sekitar 2,5 - 3,5; pH dudenum 5 - 6; pH jejunum 6,5 - 7; pH ileum 7 - 7,5 dan pH seka 6,9.

BAB V

SIMPULAN

5.1. Kesimpulan

Simpulan penggunaan tepung apu-apu (*Pistia stratiotes* L.) hingga level 12% masih dapat digunakan dan tidak mempengaruhi kondisi profil organ pencernaan itik Magelang jantan, namun penggunaan hingga 18% dapat diberikan pada itik Magelang jantan tetapi sudah mempengaruhi kondisi profil organ pencernaan itik Magelang jantan yang menurun.

5.2. Saran

Saran yang diberikan yaitu sebaiknya penggunaan tepung apu-apu (*Pistia stratiotes* L.) dalam ransum yang digunakan tanpa bagian akar dan batang, serta pemberian tidak lebih dari 7 minggu.

RIWAYAT HIDUP

Penulis memiliki nama lengkap Azizah Nikmah Permatasari lahir di Purwodadi, Jawa Tengah pada tanggal 23 Februari 1997. Penulis merupakan anak pertama dan putri pertama dari Bapak Luthfi Hidayat dan Ibu Tri Udiningsih. Pendidikan Taman Kanak-kanak TK Islam Terpadu Nurul Islam Tengaran tamat pada tahun 2003, Sekolah Dasar SD Islam Terpadu Nurul Islam Tengaran tamat pada tahun 2009, Sekolah Menengah Pertama di SMP Negeri 9 Salatiga tamat pada tahun 2012 dan Sekolah Menengah Atas di SMA Negeri 3 Salatiga tamat pada tahun 2015. Tahun 2015 penulis melanjutkan pendidikan di Universitas Diponegoro, Semarang pada Program Studi S1 Peternakan, Departemen Peternakan, Fakultas Peternakan dan Pertanian melalui program Seleksi Bersama Masuk Perguruan Tinggi Negeri (SBMPTN). Penulis berhasil mempertanggung jawabkan Laporan Praktek Kerja Lapang yang berjudul “Kajian Proses Pembuatan Pakan Konsentrat Sapi Potong P 122+ di PT Andini Megah Sejahtera Boyolali, Jawa Tengah” pada bulan Januari 2019.
