ABSTRAK

Latar belakang : Balita dalam rumah tangga rawan pangan berisiko lebih besar untuk mengalami berat badan bayi lahir rendah (BBLR) dan *stunting*. BBLR berkorelasi signifikan terhadap penyakit infeksi akibat imunitas yang kurang baik sehingga berisiko lebih tinggi terhadap *stunting*.

Tujuan : Menganalisis hubungan antara tingkat kerawanan pangan dan penyakit infeksi pada balita *stunting* dengan riwayat BBLR dan non BBLR di Jawa Tengah berdasarkan data SSGI 2021.

Metode : Desain penelitian *case-control* dengan perbandingan 1:1. Tingkat kerawanan pangan dan penyakit infeksi sebagai determinan *stunting* pada balita dengan riwayat BBLR dibandingkan dengan *stunting* pada balita non BBLR. Analisis yang digunakan adalah uji *chi-square*.

Hasil : Tingkat kerawanan pangan ($p = 0,001$, OR = 0,355 (0,192-0,656)) dan penyakit infeksi ($p = 0,014$, OR = 3,272 (1,224-8,749)) berbeda signifikan antara balita *stunting* dengan riwayat BBLR dan non BBLR. Balita BBLR dengan riwayat penyakit infeksi 3,272x lebih berisiko mengalami *stunting*.

Simpulan : Terdapat perbedaan signifikan antara tingkat kerawanan pangan dan penyakit infeksi pada balita *stunting* dengan riwayat BBLR dan non BBLR. Penyakit infeksi adalah faktor risiko sedangkan kerawanan pangan menjadi faktor protektif kejadian *stunting* pada balita dengan riwayat BBLR.

Kata kunci : *stunting*, BBLR, kerawanan pangan, penyakit infeksi, SSGI

**Levels of Food Insecurity and the Incidence of Infectious Diseases in Stunting Toddlers with a History of LBW and Non LBW
(SSGI Data Reanalysis 2021)**

ABSTRACT

Background : Toddlers in food insecure households are at greater risk of experiencing low birth weight babies (LBW) and stunting. LBW has a significant correlation with infectious diseases due to poor immunity so that it has a higher risk of stunting.

Objective : To analyze the relationship between the level of food insecurity and infectious diseases in stunting toddlers with a history of LBW and non LBW in Central Java based on SSGI 2021 data.

Methods : Case-control research design with a ratio of 1:1. The level of food insecurity and infectious diseases as determinants of stunting in infants with a history of LBW compared to stunting in non-LBW infants. The analysis used was the chi-square test.

Results : The levels of food insecurity ($p = 0.001$, $OR = 0.355$ (0.192-0.656)) and infectious diseases ($p = 0.014$, $OR = 3.272$ (1.224-8.749)) were significantly different between stunting toddlers with a history of LBW and non LBW. LBW toddlers with a history of infectious diseases are 3.272x more at risk of experiencing stunting.

Conclusions : There is a significant difference between the level of food insecurity and infectious diseases in stunting toddlers with a history of LBW and non LBW. Infectious diseases are a risk factor while food security is a protective factor for stunting in infants with a history of LBW.

Keywords : stunting, low birth weight, food insecurity, infectious disease, SSGI
