

ABSTRACT

Poverty is very complex problem, so the way to overcome it also requires proper analysis by involving components that are directly involved in poverty problems. The right strategy is needed in handling poverty alleviation that is sustainable and not contemporary. The city of Palopo, which is the place where the program is implemented, who wants to work what is the population in this study.

The analysis used in this study is the logit model regression method, using secondary data obtained from the Palopo Municipal Coordinating Team for Poverty Reduction (TKPK). The results showed that the provision of social facilities, the variable providing economic facilities and the variable providing job training had a positive impact on the who wants to increase the income of the poor in Palopo City.

The Palopo City Government, in this case the Regional TKPK of Palopo City, is expected to evaluate the poverty alleviation program being implemented to become a reference for whether the program is feasible to continue or to launch a new poverty alleviation program that is in accordance with the needs and conditions of the community.
