Beef is one of the many livestock manufacturing products that prone to contamination by microorganism. Water and nutrition contents make an ideal medium for the growth and proliferation of microorganism. Contaminated beef will degrade and has less storage duration. Beef is valued by two factors; its price and its quality. The quality itself is measured using four features; marbling, color of tendon, color of fat, and beef density. Specifically, marbling is the dominant parameter that determines meat's quality. Determination of beef quality is conducted visually by comparing the actual beef and reference pictures of each beef class. This process is very subjective in nature. Therefore, this research aims to develop an automatic system to determine beef quality based on the marbling score using the image processing technique. Image segmentation is carried out using the thresholding method and classification with the decision tree algorithm. The features used to differentiate beef quality are marbling score, beef color, and fat color. Results indicate that the system developed is able to acquire images and identify beef quality. Results of testing system showed that the image acquisition at a distance of 30 cm gives 100% accuracy, while at a distance of 20 cm has a 93.33% accuracy. Moreover, image acquisition using a 5 MP camera yields 92,22% accuracy compared to the one using either 3.2 MP with 92,22% accuracy and 4 MP cameras with 91,11% accuracy.
